with the **KSE 100**

Nelson is your partner for stud welding!

With the **KSE 100 NELSON stud welding technology** has once again proven how practical applications for welding systems can be developed at our Gevelsberg facility. The new servo-electric technology offers enormous advantages in many areas of application. For example the servo-electric operated welding head ensures that all movement during the welding process is carried out in a controlled manner even in especially demanding welding situations. As usual all components in the **KSE 100** system are of modular design and fully compatible with one another.
